Overview

FullPage.js is a Javascript plugin that allows you to make beautiful full page websites with almost no work on your end!

Why fullPage.js?

The second I saw this plugin, I knew I wanted to use it. Over time I have discovered/admired several beautiful websites that are designed this way. I have always wanted to make one of the websites and code everything myself but since I am not quite that skilled yet, I figured this was a good first step towards achieving that goal.

My example

For my fullPage.js example I created a simple site that showcases several features the plugin has. My example shows how to create the full page site and how to implement different visuals like video background, sliders, background images, and a few other smaller features. Other features of the plugin include several transition animations, custom animation speeds, event handlers (i.e. window resizing, leaving a slide, loading a slide, etc.), and much more.
